

Alb 19/91

My Dear Sir

Your box of specimens arrived safely. As far as I can make out all may be referred to P. princeps and me (no 3 →) (seems to have the procaep attached). The

Both the specimens in no 5 may be from Rhodan or Rhoeus. Phyllosum. Three complete specimens should be looked for

~~stem no 5~~ It is different from ~~the others~~. ^{The stem → see no 4} It may be a fragment of P. whistoni, or perhaps a young stem of P. princeps

~~samples only to their possession to each the few appear to be~~ ~~specimens, especially in young stems.~~

The broader stems in margin of no 1 are probably Rhodan

I shall put up a box true characteristic specimens of Phyllosum so that you can compare for yourself.

Some also put in small pieces of specimens

Phyllosum no shall occur in the Upper Devonian but does more characteristic of the lower parts of the Silurian. I have never found it in the Lower Carboniferous.

Yours truly
Chas H. Peper } ^{Edw Jones}
