

Note on a species of *Lignocarpus*

The specimens to which this note relates occur in the cave measures at Red Bank Cape Breton in a layer of hard calcareous sandstone a coarse cementation which abounds in *Leptopora* mass of them not *Leptopora* and *Leptopora* of Cole's form and *Leptopora*. So far as I can ascertain all belong to one species which is entirely of Red Bank Q. 3 and in length 0.2 inch in breadth. (Fig 1) ~~and~~ ~~to the same specimens which I believe to be~~ of the same species. The surface presents a pitted with thin striated aspects. In length of this note can be taken a recent one. Seen under what is thin and marked extremely with wrinkles some gray it when magnified presents the appearance of murex leather. Fig 3. & 5 (b) — Fig 4 shows a part of the outer surface of the ^{from the outer surface of the *Leptopora* (Fig 2)} magnified. ^{from the outer surface of the *Leptopora* (Fig 2)} With this is seen a smooth nucleus colored and strong dots marks of a ~~broader~~ curly — at the smaller end. In most specimens the nucleus is colored & of a light brown color but in some the end on which the curly is curved into the *Leptopora* so that when the surface is made the end and its surface ^{as if a common in *Leptopora*} can be seen clearly — Fig 5 & 6 do. I have made two couple days of the *Leptopora* as seen under the microscope as *Leptopora* does in a specimen cut lengthwise that the Centre is. In the *Leptopora* the *Leptopora* is used with the a part, and the *Leptopora* when the *Leptopora* is very clear.

Callender says not only the *in* the
carp part of the large seeds of
juncus with which the structure
and the marks in the paper
of the Lake Superior by clay cover-
ments. I hope the gun & the
gun requires that I do not
attach more value to the analysis
than this species of entire rough paper
le. Mulberry of paper of it upon
Hyemumers. It is much in color
very much of splendor. Since it is
of the same type with the juncus
carp so doing when in the color
of exact styles and using them
as the small pieces and what
in margin I suppose to be the
seeds of these plants.
