

March 17/76

Dear George

I have received from you  
 the slides of Permian into  
 forams. He says he has  
 shown them to Parke; but  
 they do not seem to have  
 made much of them.  
 He makes an Am. Globigerina  
Celacea, Lectulacina globulosa  
 etc. = T. fibrosa d'Ab. Planorbis  
aria? and says that the  
 small Planorbina = like shells  
 may be am. globigerina. The  
 other Lectulacina he does not  
 seem to have found. In  
 his examination accounts to  
 little of interest.

Hague of Clarence King  
 Survey was here yesterday, &  
 wanted very much to know  
 all about crystalline rocks of  
 Laurentian & Huronian age.

9  
I have received one *Sarracenia* from you  
and a letter from a Mr. Green  
with *Sarracenia* history from 1818;  
of it as a note in your paper -  
now in paper

showed him your Lake of the Woods specimens  
which he deemed to think were very much  
like some in the Rocky Mts on the 40th  
parallel. He told me that Merrill  
of Hayden's Survey, quite a young man,  
is dead. Hayden seems to have great  
difficulty in getting his appropriations this  
year, he wrote to me a short time since,  
asking a letter stating the value of his  
work, which I am sure you would be  
better able to do than I. He seems mightily  
pleased with your Report. I have had no  
time yet to finish exam of your B. C. forest plants.  
Ever your affectionately father  
W. D. Brown
