

10 Uverdale Road, Chelsea,
London. W.

May 7/94

My dear Sir William

Yours of April 20th has come to
hand with its enclosed specimen -
This I think is Estheria Dawsoni.

Woodward & I are further preparing
a paper on the fossil Phyllopora, &
I will introduce in it a ^{note} ~~word~~
or two about your specimen, which
shall be returned in due time. I think
that I can discern better signs of
ornament in it than in Stenocera
Laves from Nova Scotia (Scott).
- though the valve itself is imperfect.

On account of several unavoidable
circumstances, I have been giving
my attention of late (for two years)

to Foraminifera, as much as a
how then to Entomostraca
and I have not been able to get
down & think steadily about the
phylogeny &c. of the Beudantic
Group - as I told your son I hope
to do! - If life be long enough,
the thoughts will come, I have say -
but all we shall ever know much
"until we get there" - as dear John
Phillips said -

I am pleased to
find the (reg) Foram: Monograph
now for the Pub. Soc. & several friends
are helping me; - at the same time
my other ploughs work parallel
lines & furrows for other crops, -
just as your & other folks' work goes
on in various fields of research -

I need only say just now that your
specimen is Ecthema Dawsoni, &
that when we shall have done
with it, it will be carefully
returned - I hope to send

you before long a little
packet of miscellaneous notes
sketches by your old friend
