McGILL UNIVERSITY ARCHIVES
ACC. NO. 2211/67
REF. 41

sent you a day or two ago,
a specimen of a plant that
occurs in the minutest commu-
tation as well as in lengths of
6 to 8 ft. ¹⁸⁴⁹ There is a deal in
Johns River ¹⁸⁴⁹ at a lower junction
of Shenandoah with Portage Run. 2 1/2
inches wide at the base 2 inches at
top and often inches longer. I saw
the plant, for the seed is (cf) by 8 ft.
The plant was 2 Weeks not more
much longer. It is the same as
the specimen (large one sent, the
smaller specimen sent with the
larger one by mail) or the common-
muted plant (of which there are
kinds 4 ft x 10 ft often) - and the
better seed, half cool and
half dull iron. I will mail
you a specimen of the dry or poditic
form ¹⁸⁴⁹ which extends into
a great and is a distinct !
The "d. g. darker specimen" is not
a fern - that is an approach
to it. I have two choice specimens.
The one I detached for you in a mine
with layers attached to the stem of the
mine clamber. The other is a mine with
leaves at length inter of the clamber !
of the clamber !
