

Hamilton May 1st 1880

Prof. Dr. Dawson,
President of McGill University.

Dear Sir

I hope that at this very interesting point of your Academic Career when from both sides of the ocean warm greetings and deserved acknowledgements have been flowing in abundantly, an expression of grateful feeling and warmest goodwill from a beginner in Scientific work, will not be unacceptable. We have no man in Canada today who represents as much Scientifically as the honoured President of McGill University. I sincerely hope that you may be favoured with many long years of healthful prosperous toil and that our Canada may have increasing reason to be proud of your connection with one of her most prominent and efficient educational institutions &c &c.

I send you a small Zusatze that has lately appeared in Groth's Zeitschrift. The new position taken with reference to Löllingite and Leukopyrite as well as the

peculiar Combination (Pseudo rhomboid)
of six Quartz Crystals on an obtuse Rhomboid
of Calcite are the most important items.
There are twins of Calcite also of peculiar
form not uninteresting.

I am enjoying it in Hamilton
quite well, though my duties are rather
mechanical.

Wishing you increased
prosperity I am yours respectfully

R B Hare
