

Northampton Mass.

Nov 29. 1881

Dr J. D. Danson

My Dear Sir,

I suspect you misunder-
stand me in regard to sending more
specimens at present. I have a
few left which I shall be glad to
forward you from Canada if
in a few weeks, but I shall be un-
able to send in quantity until I
may get at the woods again, next
Summer. I am glad to hear of
the interesting form of *Cladostylin*.
It is difficult for me to answer your
inquiries in regard to the *Strobilic*.
The specimen Z is labelled in my
notes as from the Marcellus at Chapin-
ville Ontario Co. + I recall that before sending
I was in much doubt about the

out to me. If all the new forms are prepared by
single specimens, I shall be glad to have you
keep them until after next summer's meeting
at Newcastle or until they can be returned
by deep seaists.

Yours Very Truly

John W. Clark

Specimen which had lost its locality
I felt best satisfied in referring it
to the Geneva. A second consideration
of the matter with the specimen
in sight, would I think, for several
reasons, incline me to believe my
recorded locality from the Marcellus
the correct one. If it is the latter
there are no *Lepidodendron* associated
with it; if from the Geneva, I cannot
tell its horizon I cannot say of its
associates. I am quite anxious
that you shall have representatives
of all the forms you find to be new
or interesting among my specimens
you will take the liberty, as I have
already suggested of taking any
specimen, when you can also leave
