

My dear Sir

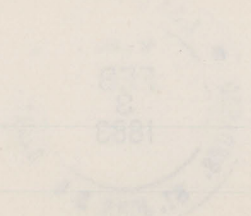

I received and will hand to your Society on Tuesday your memoir on the Terrestrial Reptiles of the Joggins Section. I see that you have followed up your former investigations with profit and have secured no less than 50 individuals. Such perfect remains of animals so rare must be of immense value to Science.

My article on Paradoxides does not contain descriptions of the Park (tata, segments and free cheeks) as I hoped to be able to place say what species they belonged to from further study the past summer, this I have not been able to accomplish. But if you would care to have a description of these parts as originally prepared to go with the head and the second plate of figures-explanatory, as a supplement to my article, I can send them to the Society - There would be the second plate ^(same size as the one sent) of figures, and text of about one quarter of the bulk of that already sent in.

I remain, dear Sir,

yours very truly
J. Mathew.

P.S. Fontaine's Flora of Virginia Permian interest, and seems parallel to the Upper Measures of P.E. Island as you describe them. The formation

Matthew

1883

Faint, illegible handwritten text, likely bleed-through from the reverse side of the paper.
