

George
Murray

London Novr 20
1870.

Dear Papa,

There is really nothing to
write this week, everything has gone
on in the same regular course.

Brady when he sent the Entomus did
not mention the two net ones at all,
but probably he may do so in the
paper or notice which he intends
putting in the annuals.

The Newcastle Brady has, as I think I

told you sent the papers he mentioned

they are very interesting & full of natural history

information & I have a few more to send you

if you wish. I have a few more to send you

if you wish. I have a few more to send you

if you wish. I have a few more to send you

if you wish. I have a few more to send you

if you wish. I have a few more to send you

Belfast. I have not yet heard
anything of the cephalopods from
him. The box of models & the
little case of minerals which you
bought when here are now coming
in usefully for the mineralogy.

Nicol though old seems to go far more
thoroughly into the crystallographic
part, than even the new large edition
of Dana. I can't think why he says
so little about it. I got his huge volume
~~down~~ at the library the other day, in hopes
of finding some good account of the
thing but found it was excessively
bare.

Nov 24

I see by the Witness, (which comes quite regularly)
that Richardson has been surveying by the
Saguenay as far as Hudsons Bay & has found
Noy lake St John a flat limestone country of
great E & W. extension. A gentleman connected
with the H. B. Comp^y at Chicoutimi, & who I saw at
Fadousac told me that such a valley existed, & that
Indians from near the Rocky Mountains sometimes
came across by it & fished on the Labrador coast for
time. Your affectionate son J. N. Dawson
